

Magpie

Magpie 3 Software

Magpie 3 is a Microsoft Windows® compatible program used with data recording systems manufactured by MEA including our Weather Stations, Soil Moisture Monitoring and Custom Engineering systems. The software provides an easy-to-use tool for the collection and display of data.

- Easy-to-use graphs and tables
- Data collection via the Internet
- Compatible with XP, Vista, Windows7, Windows 8

Data can be displayed as tables, graphs or wind-roses, and exported as tables or image files. Users can quickly customise the way data is displayed in any format using a wide range of options and save the resulting tables and graphs as Favourites.

Magpie 3 allows users with multiple data recording systems to combine data from several systems in one graph, open any table from different systems simultaneously, and collect data from multiple systems with a single unload command.

Magpie 3 is used to communicate with the data recorder in your MEA system, to upload logger programs, and to retrieve data via direct serial cableconnection, or over the Internet.

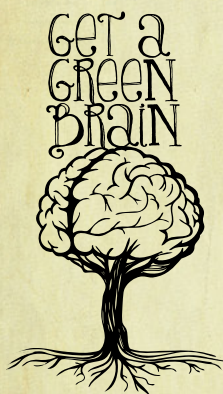

Magpie 3 can be automated to unload data from a logging system at user-selected intervals.

Magpie 3's powerful Scheme Editor allows users to construct their own logger programs using its comprehensive instrument library. Advanced users can create and maintain their own custom instrument libraries.

Specifications for Magpie 3 Software

System Requirements	CPU: Pentium 3; RAM: 64MB; HDD: 100MB free space; Video: SVGA (800 x 600 min display), 256 colours or better.
Supported Operating Systems	Windows® 2000, XP, Vista, 7, 8
Supported Data Loggers	Plexus, MAX, ProMAX
Backwards Compatibility	Magpie 2, free upgrade and updates at www.mea.com.au
